

What I have done so far:

So far, I have migrated my semester one project from a PyGame app to a local server and web page I can launch on my computer. It is at the point now where I can connect to a room where I can play against the AI agents.

What I still need to do:

I still need to implement some fixes to the poker engine, specifically the hand evaluator. My UI also needs a lot of refinement, as it is just in a temporary state to make the game playable right now. I will also need to implement more tests and validate that my game is running as intended once fully implemented. Finally, I will need to host my server online so that multiple human players can connect to it, rather than locally hosting it, which only allows one human player.
