

POKER FACE 2

What is Poker Face 2?

Poker Face 2 is an interactive Texas Hold'em poker simulation where a human player competes against an AI opponent.

The AI begins with no prior assumptions about the player and learns during the session by observing betting patterns, bluff frequency, and decision tendencies.

This creates a more dynamic and personalized gameplay experience than traditional static poker bots.

Project Goals

The primary goal of Poker Face 2 is to create a fully functional web-based No-Limit Texas Hold'em application that users can access instantly through a browser without any downloads or installations.

In addition to providing smooth gameplay, the project focuses on developing AI opponents that learn from player behavior in real time and adjust their strategies throughout each session.

By combining accessibility, multiplayer interaction, and intelligent opponents, the project demonstrates how modern web applications can deliver engaging AI-driven experiences.

Project Challenges

One major challenge in the project was creating AI decisions that feel believable and strategic. If the AI acts too randomly, it appears weak; if it follows rigid patterns, it becomes predictable and easy to exploit. To address this, the decision system combines multiple inputs such as hand strength, betting context, and the current player model so that actions feel more natural and responsive.

A second challenge was accurately learning player behavior early in a session when only a small amount of data is available. With too few observations, predictions can be unreliable. This was mitigated by using simple behavioral metrics that update after every hand, allowing the AI to improve gradually as more information is collected.
