

What I have done since the last report:

I updated the poker hand evaluator to use the correct hand ranking and tie-breaking logic (based on the World Series of Poker ruleset). I also added/modified tests to ensure the correct behavior is being upheld.

I have also started refining the UI where the player interacts with the poker room to be more intuitive.

Lastly, I have trained my agents in more scenarios to improve their performance.

What I still need to do:

I need to continue working on my UI to further improve not just the gameplay scene, but also the menus.

I would also like to train my agents more to further improve their performance.

There are always more tests to be added as I add features and change how things are set up, so I will do that as well.

Finally, I am looking into hosting my server on my LMU Build site to make connecting to it easier. From my investigations so far, that will require me to change the structure since cPanel doesn't handle websockets well.
